

ABSTRACT OF THE DISCLOSURE

A method is disclosed for verifying whether an implementation rule assigned to a medical procedure has been observed. The method includes: data correlated with the procedure is automatically entered and stored in a data processing device; test criteria for the data, which are correlated with the implementation rule, are stored in a test system; the procedure is implemented; the test system reads out the data from the data processing device; and the test system evaluates the data based on the test criteria and determines to what degree the implementation rule has been observed.
